

Ramsey theory and Rado's numbers

Adrian Galicia

Mentor: Kellen Myers

Objective

- Create an algorithm to compute Rado numbers
- Implement the algorithm in a web-friendly language (javascript, PHP, etc.)
- Visualizing the computation
- Prove the output (Rado numbers) with certificates.

Ramsey Theorem

- Given some edge-coloring of a complete graph, Ramsey's Theorem states that there exist monochromatic sub graphs (depending on how many colors are used).
- If two colors are used (red & blue), for any positive integers (r,s) , there exist a positive integer $N=R(r,s)$ where a coloring of $K[N]$ will give $K[r]$ red or $K[s]$ blue.
- The $R(r,s)$ is smallest integer N for which the theorem holds.

Ramsey's Theorem example

Ramsey's theorem example

Rado number

- Given some equation “E” such as $x+y = z$ and some number of colors “r” ($r=2$, red and blue in this case), find the N so that there is no way to color 1 through N without a solution to the equation E of the same color.
- This is analogous to $N=R(r,s)$, like $R(3,3)=6$. As showed in the graph, $K[5]$ is the smallest number you can color and avoid monochromatic $K[3]$.

Rado number example

$$x+y = z$$

■ $N = 1$

$$1+1 = 2$$

$$x+y = z$$

1

$$1+1 = 2$$

$$x+y = z$$

1

■ $N = 2$

$$1+1 = 2$$

~~1 2~~

1 2

1 2

$$1+1 = 2$$

~~1 2~~

■ $N = 3$

1 2 3

1 2 3

1 2 3

1 2 3

■ $N = 4$

~~1 2 3 4~~

~~1 2 3 4~~

1 2 3 4

~~1 2 3 4~~

~~1 2 3 4~~

1 2 3 4

~~1 2 3 4~~

~~1 2 3 4~~

■ $N = 5$

~~1 2 3 4 5~~

~~1 2 3 4 5~~

~~1 2 3 4 5~~

~~1 2 3 4 5~~

Tree output

$$x+y = z$$

Can be omitted.
mirror image.

Ultimate goal

- Make a program that gives out the least Rado number given some equation taken from the user input.
- If possible, it will not only work with 2 colors but with 3 or more colors.
- It will have a tree stylized output (certificate).

Languages used

- HTML
- CSS3
- JavaScript

Demonstration

- [rado_number_1.html](#)
- Main Functions
 1. calculateN ()
 2. checkColoring()
 3. intoColors ()
 4. drawTree() (not finished)

How does it works(1)

■ 0	←	● valid	→	● 1
■ 00	←	● not valid	→	● 1, 2
■ 01	←	● valid	→	● 1, 2
■ 010	←	● valid	→	● 1, 2, 3
■ 0100	←	● not valid	→	● 1, 2, 3, 4
■ 0101	←	● not valid	→	● 1, 2, 3, 4
■ 011	←	● valid	→	● 1, 2, 3
■ 0110	←	● valid	→	● 1, 2, 3, 4
■ 01100	←	● not valid	→	● 1, 2, 3, 4, 5
■ 01101	←	● not valid	→	● 1, 2, 3, 4, 5
■ 0111	←	● not valid	→	● 1, 2, 3, 4

$$x+y = z$$

If valid a zero is added (red number) else the last color gets replaced by the other color

How does it works (2)

Coloring : 1, 2, 3, 4, 5, 6

$$2X + 4Y = 7Z$$

X 2(n)	Y 4(n)	X+Y combs.	Z 7(n)
		$4+8=12$ $2+4=6$	
4 8, 10	8 16, 20	12, 20, 24, 16, 24, 28, 18, 26, 30	14, 28, 32
2 6, 12	4 12, 24	6 14, 26, 10, 18, 30, 16, 24, 36	7, 21, 42

If a number in the 3rd column is in the 4th column , then that is the monochromatic solution to the equation which means that the coloring is not valid

How does it works(3)

$$x+y = z$$

- intoColors()
 - Takes the string of zeros and ones [0,1,1,0,0] and converts them into a numbers with colors [1, 2, 3, 4, 5] to be outputted in the screen.
 - If a coloring is not valid it highlights the values for which the coloring has a monochromatic solution for a given equation.

1, 2, 3, 4, 5 coloring not valid
 $1(1) + 1(4) = 1(5)$

How it works (4)

$$x+y = z$$

- drawTree()

- Takes the biggest non extensible colorings and orders them by length.
0,1,1,0
0,1,0

- Makes a list structure of the longest one.

- Then compares it to the next coloring and at the location where they differ adds a colored number
- And then a CSS style sheet changes its appearance to an actual tree

Another tree

$$x+2y = z$$

Future Work

- Finish the tree output
- Add feature of testing a single coloring on demand.
- Test several equations
- More variables
